### **EXPLANATORY NOTES**

### Introduction

The monthly Population Survey (which is described in *The Labour Force, Australia* (6203.0)) comprises the monthly labour force survey and supplementary topics. This publication contains some results of a supplementary survey run in association with the May 1986 labour force survey conducted throughout Australia.

2. Of the respondents to the labour force survey, those who fell within the scope of the supplementary were asked additional questions. This subset of respondents was asked whether they were attending, or had attended in the previous year, an educational institution, and, if so, the type of educational institution and the type of attendance. If respondents were not attending an educational institution full-time at May 1986 they were asked the year they finished full-time study. Persons who had left full-time study during the previous year were asked the time of the year they had left. In respect of apprentices, information was obtained on their year of apprenticeship and field of trade.

### Scope

3. The scope of this supplementary survey was the same as that used for the labour force survey (described in full in *The Labour Force, Australia* (6203.0)) except that it was restricted to persons aged 15 to 64 and excluded persons permanently unable to work, some patients in hospitals and sanatoria and inmates of reformatories, jails, etc. The population for apprentices was further restricted to employed persons aged 15 to 34.

### **Definitions**

- 4. Definitions of the principal labour force categories appearing in this publication are given in *The Labour Force, Australia* (6203.0).
- 5. An educational institution is defined as any institution whose primary role is education. Included are schools, universities, colleges of advanced education, colleges of technical and further education, public and private colleges, etc. Excluded are institutions whose primary role is not education, for example hospitals.
- 6. The classification other educational institution, which is part of the variable type of educational institution attended/ing includes: business, commercial and secretarial colleges; religious and theological colleges; and overseas institutions.
- 7. Persons are regarded as attending an educational institution full-time if they consider themselves to be attending full-time or the institution which they are attending so classifies them.
- 8. A tertiary institution is defined as any educational institution other than a school.
- 9. Leavers from educational institutions are persons who were full-time students at some time in the previous year but were not full-time students at the time of the survey.

- 10. Apprentices include only those employed persons aged 15 to 34 who indicated in the survey that they were apprentices.
- 11. The *field of trade* is derived from information provided by apprentices on their occupation.
- 12. Unless otherwise stated, all characteristics referenced in this publication are as at the survey week.

### Results of the survey

- 13. Due to differences in the method of estimation used in this supplementary survey and that used in the labour force survey, there are some small variations between estimates in this publication and those in the May issue of *The Labour Force, Australia* (6203.0).
- 14. The estimates in this publication refer to information collected in the survey month and, due to seasonal factors, may not be representative of other months of the year.
- 15. Additional tables available but not included in this publication are listed on page 18. A preliminary publication (6241.0) containing a summary of the results of the survey was issued on 22 September 1986.
- 16. Results of similar surveys, the first conducted in February 1964, have been published in previous issues of this publication. Information on apprentices was collected for the first time in May 1983.
- 17. It is proposed that this survey will next be conducted in May 1987.

### Discontinuities in the series

- 18. The scope of surveys prior to 1977 was restricted to persons aged 15 to 24 and from 1977 to 1980 inclusive, 15 to 25. In 1981 the survey was expanded to include all persons aged 15 to 64. Care should therefore be exercised in comparing estimates from this survey for persons aged 15 to 24 with those from previous surveys which relate to persons aged 15 to 25.
- 19. Since 1979, and also in 1975 and 1976, the survey has been enumerated in May. However, in 1977 and 1978 it was enumerated in August and from 1964 to 1974 in February. Care should therefore be taken in comparing estimates from this survey with those from surveys which were enumerated at different times of the year.
- 20. Estimates contained in this publication are based on a revised labour force questionnaire introduced in April 1986. The definition of employment was expanded, resulting in decreases in the estimates of unemployed persons and persons not in the labour force. Further information is contained in The Labour Force, Australia (6203.0) and in an information paper Questionnaires Used in the Labour Force Survey (6232.0). Although estimates for previous years have not been revised in this publication, the May issue of The Labour Force, Australia (6203.0) contains revised estimates back to April 1985.

### Reliability of the estimates

- 21. Estimates in this publication are subject to two sources of error:
  - (a) sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings, they may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical Note.
  - (b) non-sampling error: inaccuracies may occur because of imperfections in reporting by interviewers and respondents, and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

### Related publications

### **SUMMARY OF FINDINGS**

An estimated 19.1 per cent (1,995,900 persons) of the civilian population aged 15 to 64 at May 1986 attended an educational institution in 1985. Of these persons 58.3 per cent attended full-time while 41.7 per cent attended part-time.

Most persons who were attending universities (57.5 per cent), colleges of advanced education (66.5 per cent) and TAFE/technical colleges (75.2 per cent) at May 1986 were employed. While the equivalent proportion for those people attending schools was substantially lower, it nevertheless stood at a relatively high 25.8 per cent. 90.3 per cent of employed persons attending school were working part-time, compared with only 26.5 per cent of employed persons attending tertiary institutions.

Attendance at educational institutions has tended to increase over the last 4 years, and has been significantly outpacing population growth. Part-time attendance across all age groups has increased by 20.4 per cent in that time, the most significant growth being observed in the 25 to 64 age group (a growth of 35.2 per cent). Full-time attendance has risen by 18.0 per cent over the same period.

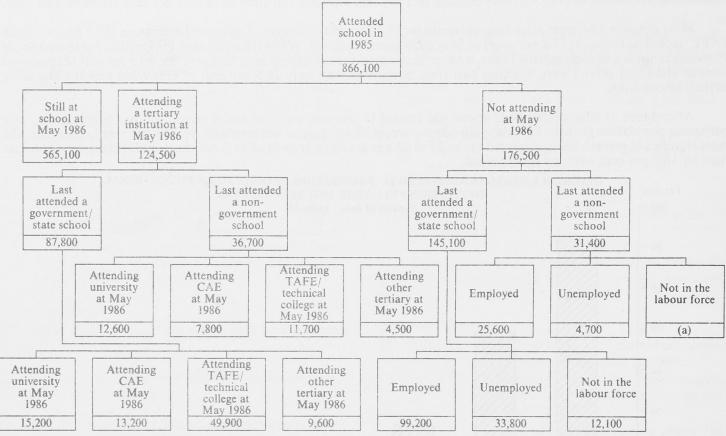

A total of 1,054,400 persons aged 15 to 24 were attending an educational institution at May 1986. 812,400 were attending full-time while 242,000 were attending part-time (representing 30.9 per cent and 9.2 per cent of the civilian population in that age range respectively). The highest proportion of full-time attendance was in the 15 year age group (92.2 per cent) which steadily decreased to the 20 to 24 age group (8.3 per cent). Among 15 to 17 year olds who were attending full-time, school constituted the major educational institution attended (99.0, 93.6 and 79.4 per cent respectively). CAE and TAFE/technical colleges accounted for 44.8 per cent of full-time students aged 18 to 19, while the major educational institution attended by the 20 to 24 age group was university (47.4 per cent).

Of the 866,100 persons aged 15 to 24 who attended school in 1985, 34.8 per cent (301,000) were no longer attending school at May 1986. For those no longer attending it was established that 77.4 per cent (232,900) had last attended a government/state school, while 22.6 per cent (68,100) had left a non-government school. The proportion of unemployed persons was larger among the first group (22.1 per cent) than among the second (15.1 per cent).

The majority of people aged 15 to 24 who attended school in 1985 were still attending school at May 1986 (65.2 per cent) and 14.4 per cent (124,500) were attending a tertiary institution at May 1986. Of those who had progressed to a tertiary institution 29.5 per cent had last attended a non-government school and 70.5 per cent had last attended a government/state school. While 53.9 per cent of persons who attended a non-government school in 1985 went on to a tertiary institution, only 37.7 per cent of persons who attended a government/state school did so. There are also differences between these two groups in terms of the type of tertiary institution they were attending at May 1986. While 34.3 per cent of people who had last attended a non-government school and were attending tertiary at May 1986 had proceeded to university and 31.8 per cent to TAFE/technical colleges the equivalent proportions for people who had last attended government/state schools were 17.3 per cent and 56.8 per cent respectively.

DIAGRAM 2. PERSONS AGED 15 TO 24 WHO ATTENDED SCHOOL IN 1985: WHETHER ATTENDING AN EDUCATIONAL INSTITUTION, TYPE OF SCHOOL LAST ATTENDED, TYPE OF EDUCATIONAL INSTITUTION ATTENDING AND LABOUR FORCE STATUS, MAY 1986

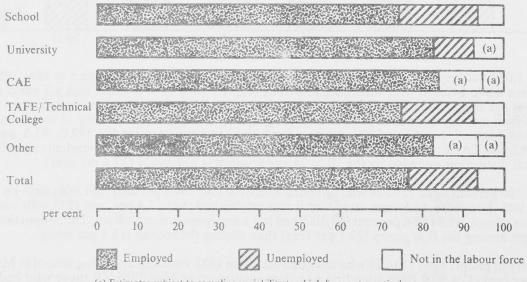

(Source of data: Tables 10, 12 and 13)

(a) Estimate subject to sampling variability too high for most practical uses.

Of those persons aged 15 to 64 who attended an educational institution full-time in 1985, 30.6 per cent were not continuing full-time study at May 1986. Of these, 76.7 per cent were employed, 16.8 per cent were unemployed and the remaining 6.5 per cent were not in the labour force. The unemployment rate was considerably higher amongst leavers from school (20.8 per cent) than leavers from tertiary institutions (13.9 per cent). The majority of employed leavers worked in full-time jobs (86.3 per cent).

DIAGRAM 3. LEAVERS AGED 15 TO 64: TYPE OF EDUCATIONAL INSTITUTION ATTENDED FULL-TIME IN 1985 AND LABOUR FORCE STATUS, MAY 1986
(Source of data: Table 17)

(a) Estimates subject to sampling variability too high for most practical uses

The wholesale and retail industry had the highest proportion of leavers aged 15 to 24 working in it (30.5 per cent; 75.5 per cent of these attended school in 1985) followed by the finance, property and business industry (17.4 per cent).

Occupations in which high proportions of employed leavers aged 15 to 24 were working are clerical (30.0 per cent) and trades and production-process workers etc. (29.6 per cent). Females constituted 73.4 per cent of the leavers with clerical occupations whilst males constituted 90.3 per cent of the leavers with trades and production-process workers etc. occupations.

At May 1986 there were an estimated 134,500 apprentices aged 15 to 34 (1.3 per cent of persons aged 15 to 64 or 2.0 per cent of employed persons aged 15 to 64). This estimate is down 9.0 per cent on the 1985 estimate and is the lowest observed since 1983. Females constituted 11.1 per cent (14,900) of the total estimate of apprentices at May 1986, with the majority being employed in the service field of trade.

Fields of trade in which relatively large numbers of apprentices worked were building, metal and mechanical and automotive. The decrease in the number of apprentices between 1983 and 1986 was most evident in the metal and electrical fields (a decrease of 39.4 per cent and 34.9 per cent respectively). On the other hand, at May 1986 there were 13,600 apprentices in the food and drink field, as compared with 10,800 in 1985.

The majority of apprentices were aged 17 to 19 (60.2 per cent) and were employed in the non-government sector (86.8 per cent). Approximately one third of apprentices were in their first year of apprenticeship whilst 28.3 per cent were in their second year.

The manufacturing (24.0 per cent), wholesale and retail trade (23.5 per cent), construction (18.3 per cent) and recreational, personal and other service industries (15.8 per cent) employed the most number of apprentices. 35.9 per cent of apprentices in the manufacturing industry were employed in the metal field of trade whilst 54.7 per cent of apprentices in the household and retail trade industry were employed in the mechanical, automotive field of trade.

#### ADDITIONAL TABLES

The following is a list of additional tables of results from the survey which are available to users on request. These tables show a selection of estimates on an Australia-wide basis. Tables disaggregated by State/Territory and other tables may also be available. Most tables are dissected by sex.

### Persons aged 15 to 64-

- Al Whether attended an educational institution and level of course in 1985, and labour force status Labour force status and age—
- A2 Whether attended an educational institution, type of educational institution attended and type of attendance in 1985
- A3 Whether attended an educational institution and type of attendance in 1985, and family status
- Whether attended an educational institution, type of educational institution attended and type of attendance in 1985, and age
- A5 Whether attending an educational institution and type of educational institution attending at May 1986, and birthplace and year of arrival
- A6 Whether attending an educational institution, type of educational institution attending and type of attendance at May 1986, and family status

### Persons aged 15 to 64 who attended an educational institution in 1985-

A7 Type of educational institution attended in 1985 and birthplace and year of arrival

### Persons aged 15 to 64 who attended an educational institution full-time in 1985-

A8 Type of educational institution attended in 1985, whether attending an educational institution and type of educational institution attending at May 1986, and age

### Employed persons aged 15 to 64-

A9 Whether attended an educational institution, type of educational institution attended and type of attendance in 1985, and occupation

### Unemployed persons aged 15 to 64-

A10 Whether attended an educational institution and type of educational institution attended in 1985, and duration of unemployment

### Persons aged 15 to 24-

- All Age at time of leaving full-time education and labour force status
- A12 Whether attending an educational institution, type of educational institution attending and type of attendance at May 1986, and age

### Leavers aged 15 to 64-

Labour force status—

- A13 Age at time of leaving full-time education
- Al4 Level of course in 1985

### Employed leavers aged 15 to 64-

A15 Type of educational institution attended full-time in 1985 and age

### Unemployed leavers aged 15 to 64-

A16 Duration of unemployment and age

### Apprentices-

- Field of trade, and whether attended an educational institution and type of attendance in 1985

  Whether attending an educational institution, type of educational institution attending and type of
- attendance at May 1986, and year of apprenticeship

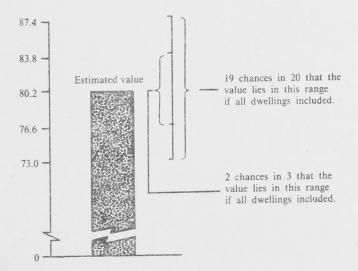

### **TECHNICAL NOTE**

### Estimation procedure

The estimates are derived from the population survey by use of a ratio estimation procedure, which ensures that the estimates conform to an independently estimated distribution of the population for each capital city and remainder of State by age and sex, rather than to the corresponding distribution within the sample itself.

### Reliability of the estimates

- Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of the likely difference is the relative standard error, which is obtained by expressing the standard error as a percentage of the estimate.
- 3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. A table of standard errors for general application is given on the following page. Since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics these figures will not give a precise measure of the standard error of a particular estimate but they will provide an indication of its magnitude.
- 4. An example of the calculation and the use of standard errors in relation to estimates of persons is as follows. Table 10 shows the estimated number of persons aged 15 to 24 who attended university during 1985 and who were attending an educational institution at May 1986 is 80,200. Since this estimate is between 50,000 and 100,000 in the standard error table, the standard error for Australia will be between 2,950 and 3,950 and can be approximated as 3,600 (rounded to the nearest 100). Therefore, there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall in the range 76,600 to 83,800 and about nineteen chances in twenty that the value will fall within the range 73,000 to 87,400. This example is illustrated in the following diagram.

- 5. As can be seen from the standard error table, the smaller the estimate the higher is the relative standard error. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates less than the lowest levels shown in the standard error table have not been published. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.
- 6. Proportions and percentages formed from the ratio of two estimates are also subject to sampling errors. The size of the error depends on the accuracy of both the numerator and the denominator. The formula for the relative standard error (RSE) of a proportion is given below:

RSE 
$$(x/y) = \sqrt{[RSE(x)]^2 - [RSE(y)]^2}$$

- 7. Considering the example from paragraph 4 above, the 80,200 persons represent 78.3 per cent of the 102,400 persons who attended university during 1985. The standard error of 102,400 is approximately 4,000 so the relative standard error is 3.9 per cent. The relative standard error for 80,200 is 4.5 per cent. Applying the above formula, the relative standard error of the proportion is  $\sqrt{(4.5)^2 (3.9)^2}$  or 2.2 per cent, giving a standard error for the proportion (78.3 per cent) of 1.7 percentage points. Therefore, there are about two chances in three that the proportion of 15 to 24 year old university students in 1986 attending an educational institution at May 1986 is between 76.6 per cent and 80.2 per cent and nineteen chances in twenty the proportion is within the range 74.9 per cent to 81.7 per cent.
- 8. Published figures may also be used to estimate the difference between two survey estimates (of numbers or percentages). Such a figure is itself an estimate and is therefore subject to sampling error. The sampling error of the difference between two estimates depends on their standard errors and the relationship (correlation) between them. An approximate standard error (SE) of the difference between two estimates (x-y) may be calculated by the following formula:

$$SE(x-y) = \sqrt{[SE(x)]^2 + [SE(y)]^2}$$

While this formula will only be exact for differences between separate and uncorrelated characteristics of subpopulations it is expected to provide a good approximation for all differences likely to be of interest in this publication.

9. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

### STANDARD ERRORS OF ESTIMATES

	N.S.W.	Vic.	Qld	S.A.	W.A.	Tas.	N. T.	A. C. T.	Aus	tralia
Size of estimate				— number						Relative standard error (per cent)
1,000						250				
1,300						280		310		
1,500						300		330
